Serious vs. Non-Serious Case Assessment Report

PHARMACOVIGILANCE QUALITY & REGULATORY COMPLIANCE ASSESSMENT

Standard: ICH E2A Guidelines
Reference: Synthetic Core Data Sheet v1.0

1.Regulatory framework and assessment Methodology

Under ICH E2A (Clinical Safety Data Management: Definition and standard for expedited Reporting) Adverse drug reactions are evaluated across three regulatory pillars,seriousness.expectedness and causality.

Distinction: severity v/s seriousness

Severity describes the intensity of event like mild, Moderate or severe, Seriousness is regulatory definition define by patient's outcome Severe reaction is not serious unless it meets regulatory criterion:(1) Death, (2) Life threatening, (3) inpatient hospitalization or prolongation, (4) Persistent disability/incapability, (5) Congenital anomaly, (6) Important Medical event

2.Case classification Metrix (Dataset Analysis)

Analysis of distinct patient cases from synthetic pharmacovigilance registry evaluate against product safety Sheets:

Case ID	Suspect drug and dose	Reported ADR	Expectedness	Seriousness Criteria	Classification	Regulatory Criteria
SYN-PV-010 (A 57-yr)	Atorvastatin 5 mg PO	Myalgia	Known (Listed)	Inpatient Hospitalization	**SERIOUS**	Routine / Periodic PSUR*
SYN-PV-001(A 33-yr)	Ciprofloxacin 500 mg PO	Tendon pain	Known (Listed)	Medically Important (IME)	**SERIOUS**	15-Day Expedited / IME
SYN-PV-008 (A 36-yr)	Losartan 5 mg PO	Fatigue	**Unexpected**	None met (non-serious)	**NON-SERIOUS**	Non-expedited / PSUR
SYN-PV-009 (A 78-yr)	Amoxicillin 5 mg PO	Rash	Known (Listed)	None met (Outpatient)	**NON-SERIOUS**	Non-expedited / PSUR
SYN-PV-019 (A 29-yr)	Metformin 5 mg PO	Nausea	Known (Listed)	None met (non-serious	**NON-SERIOUS**	Non-expedited / PSUR

3.In Depth case assessment Rationale

SYN-PV-010 (Atorvastatin –myalgia): This case classified as serious due to Hospitalization. while myalgia is listed in synthetic core data sheet v1.0. The requirement for hospitalization for acute care elevates regulatory seriousness.

SYN-PV-001 (Ciprofloxacin-Tendon pain): This case is classified as serious under criterion of medical importance. Tendon pain ruptures the risk poses potential permanent disability requiring immediate de-escalation and intervention.

SYN-PV-008 (losartan-fatigue): Cross reference of synthetic data sheet Fatigue is unexpected; however, case was not serious, does not meet any regulatory criteria. Not serious, unexpected case do not trigger expedited report, but it is log for signal detection.

SYN-PV-009 (amoxicillin –Rash): This case is classified as not serious expected. Skin rash that cleared up on its own, treated during a clinic visit without any dangerous allergic reaction.

SYN-PV-009 (Metformin-Nausea): This case was classified as non-serious expected. nausea is a common, manageable gastrointestinal effect. it does not meet the regulatory threshold for an expedited medically important event.

4.Expdited reporting Workflows and summary SOP

For compliant regulatory submission under the Guideline of ICH-E2A.

1. **Day 0 (Clock Start):** The calendar day on which any company personnel or qualified agent becomes aware of the minimum 4 reporting criteria (Identifiable Patient, Identifiable Reporter, Suspect Product, Adverse Event).
2. **7-Calendar-Day Clock:** Applies to *Fatal or Life-Threatening SUSARs*. Initial notification must occur within 7 days, with full follow-up report within an additional 8 days.
3. **15-Calendar-Day Clock:** Applies to all other *Serious, Unexpected Adverse Reactions* (Hospitalization, Disability, Congenital Defect, IME).
4. **Periodic Aggregation:** All non-serious events and serious listed events are collated into the Periodic Benefit-Risk Evaluation Report (PBRER/PSUR).
